

Overboard Discharge Units (OBD's) for wastewater disposal in Coastal Maine

Backyard neighbors of a Fuji Clean installation.

Problem:

Given local setback rules and challenging soil limitations on the rocky coast of Maine, many homeowners found themselves with overboard discharge units (OBD's) for the disposal of their wastewater. Due to the advances in wastewater disposal technologies now available, Maine has much reduced the allowed licenses for these OBD's.

Solution:

Fuji Clean USA systems have been a primary mechanism used in replacing these systems, and many of these properties are now able to adequately treat wastewater when they previously had no options.

Results:

The very small footprint needed for Fuji Clean systems, no advanced septic tank requirement, and the reduced drain field size due to the quality of effluent has made this possible. These highly efficient and environment-friendly treatment systems are helping preserve: "Maine - The Way Life Should Be".
